Acknowledgement

The project “Unique Fitness” is the Project work carried out by

Name: Sandip Kadam

UNDER THE GUIDANCE

We are thankful to our project guide for guiding us to complete the project.

Their suggestions and valuable information regarding the formation of the project report have provided us a lot of help in completing the project and its related topics.

We are also thankful to our family members and friends who were always there to provide support and moral boost-up.

Abstract

The project called **Unique Fitness** is about creating a **gym and fitness management web application** that provides users with an organized platform to explore fitness-related services and gym facilities. The system provides a digital platform where users can access information about the gym, fitness classes, nutrition guidance, and other fitness-related services through a professional and user-friendly interface.

The website allows users to **register and log in**, access the **dashboard**, explore different **fitness classes and membership plans**, view **nutrition guidance**, and learn more about the gym through the **About Us** section. Users can also apply for **free fitness classes** by submitting their details through the application form. The system is developed using **HTML, CSS, JavaScript, Python, Django, and SQLite**.

The system is designed to provide a simple, responsive, and convenient fitness experience. It helps organize gym information, fitness classes, nutrition content, and user applications in one platform. The project focuses on providing users with easy access to fitness services and creating an organized digital platform for gym management.

Introduction

In today's age of Information and Communication Technology, technology has become an important part of our daily lives. From education and communication to healthcare, business, and fitness, technology plays an important role in making activities faster and more convenient. One of the major developments in this technological revolution is the growth of web applications. These applications allow users to access services and information easily through the internet.

Our project aims to develop a gym and fitness management web application named "Unique Fitness", which provides users with a convenient platform to explore fitness-related services and gym facilities. The system allows users to register and log in, access their dashboard, explore different fitness classes and membership plans, view nutrition guidance, and learn more about the gym. It also provides a Free Class Application section where users can submit their details and apply for a free fitness class. The application is designed to provide an organized, responsive, and user-friendly experience.

The Unique Fitness project uses modern web technologies to provide an efficient fitness management platform. The frontend is developed using HTML, CSS, and JavaScript, while Python and Django are used for backend development and handling application services. SQLite is used as the database for storing user and application-related information. This combination of technologies helps create a dynamic and organized web application while providing users with easy access to fitness services and information.

Objective of the Present Work

The objectives of this project are as follows:

- To develop a **web-based gym and fitness management application** for providing fitness-related services and information.
- To provide users with an **easy and convenient platform** for accessing gym and fitness-related services.
- To provide a **user registration and login system** for accessing the application.
- To provide a **well-organized dashboard** where users can access important fitness-related features.
 - To provide information about different **gym classes**, including Strength Training, HIIT Workout, Yoga, and Cardio Fitness.
 - To provide a dedicated **Nutrition** section containing useful nutrition and healthy lifestyle information.
- To allow users to **apply for a free trial class** by submitting their name, email, phone number, and selected class.
- To manage **member and free-class application information** efficiently using the database.
- To provide an **interactive, responsive, and user-friendly interface** for better navigation and user experience.
- To provide different **membership plans** and information about the available fitness facilities.
 - To streamline gym and fitness-related services through a **single digital platform** and improve the overall user experience.

System Analysis

Problem Definition

Many gyms and fitness centers still depend on traditional methods for providing information about gym services, fitness classes, nutrition guidance, and member applications. Manual processes can make it difficult for users to access information quickly, apply for fitness classes, and manage their details efficiently.

This project solves these problems by providing a centralized Django-based Gym and Fitness Management Web Application named Unique Fitness. The system provides users with an organized platform to register and log in, access a dashboard, explore fitness classes, view nutrition information, learn about the gym, and apply for free fitness classes.

Preliminary Investigation Purpose

The Unique Fitness web application is designed to provide a digital platform for managing and accessing gym and fitness-related services. It reduces dependence on traditional manual processes by providing users with an organized, simple, and user-friendly web interface.

Benefits

- **Easy Access to Fitness Information:** Users can easily access information about gym facilities, classes, nutrition, and other fitness services.
- **User Authentication:** Users can register and log in to access the application's features securely.
- **Free Class Application:** Users can submit their details and apply for available free fitness classes through an online form.

- **Organized User Dashboard:** The dashboard provides users with access to their submitted free-class applications and other important features.
 - **Simple Navigation:** The application provides easy navigation between Home, Dashboard, Nutrition, About, Classes, and Contact pages.
-

Proposed System

The proposed Unique Fitness system provides a simple and organized web-based fitness platform.

- Users can register, log in, access their dashboard, explore fitness classes, view nutrition information, and apply for free fitness classes.
 - The Application manages member information and free-class application details using the Django backend and SQLite database.
 - The Architecture utilizes HTML, CSS, and JavaScript for the frontend, Python and Django for backend development, and SQLite for database management.
-

Feasibility Study

1. Technical Feasibility

- The system is developed using HTML, CSS, and JavaScript for designing the user interface.
- Python and Django are used for backend development, URL handling, user authentication, and application logic.
 - SQLite is used to store member and free-class application information.
- The technologies used are suitable for developing and maintaining a web-based gym management application.

2. Economic Feasibility

- The project uses open-source technologies such as Python, Django, HTML, CSS, JavaScript, and SQLite, which helps minimize software and licensing costs.
- The digital system reduces dependence on manual processes for managing member and class application information.

3. Operational Feasibility

- The application is designed with a simple and user-friendly interface, making it easy for users to navigate.
- Users can easily register, log in, access the dashboard, explore fitness-related pages, and submit free-class applications.

4. Schedule Feasibility

- The development of the project can be divided into structured phases such as frontend design, backend development, database integration, authentication, feature implementation, and testing.
 - The Django-based structure allows individual features such as login, dashboard, nutrition, and free-class applications to be developed and tested separately.

5. Social Feasibility

- The system provides users with easy access to fitness, workout, and nutrition-related information.
- It encourages users to explore fitness services and provides a convenient digital platform for interacting with gym-related services.
- The user-friendly interface makes the system accessible to users without requiring advanced technical knowledge.

Project Planning

Purpose of Project Planning

Project planning ensures that the development of the Unique Fitness gym and fitness management web application follows a disciplined and organized workflow. It defines the major development tasks, phases, and activities required to develop a functional and user-friendly fitness platform.

Phases Covered in the Plan

1. Preliminary Investigation: Defining the project scope, identifying user requirements, and understanding the requirements of a digital gym and fitness management platform.
2. System Analysis: Identifying problems in traditional gym management, analyzing user requirements, and defining the required modules such as authentication, dashboard, fitness classes, nutrition, and free-class applications.
3. System Design: Designing the website structure, navigation flow, user interface, database structure, and Django application architecture.
4. Coding: Developing the frontend using HTML, CSS, and JavaScript and implementing backend functionality using Python and Django.
5. Security: Implementing user registration and login functionality, password hashing, session-based authentication, and restricting access to protected pages for logged-in users.
6. Testing: Testing the login and registration functionality, page navigation, free-class application form, database operations, and overall website functionality.
7. Implementation: Running and integrating the Django application with the SQLite database and ensuring that all major features work properly for the users.

Software Requirement Specification (SRS): Unique Fitness

The Software Requirement Specification (SRS) outlines the fundamental requirements of the **Unique Fitness Gym and Fitness Management Web Application** to ensure efficient functionality, a smooth user experience, and easy maintainability.

System Overview

The **Unique Fitness** web application provides users with a digital platform to access gym and fitness-related services and information. The system is structured into three core modules:

1. **User Module:** Enables users to register and log in, access the dashboard, explore fitness classes, view nutrition information, and apply for free fitness classes.
2. **Fitness Services Module:** Provides information about gym classes such as Strength Training, HIIT Workout, Yoga, and Cardio Fitness, along with membership plans and fitness-related information.
3. **Free Class Application Module:** Allows users to submit their name, email, phone number, and selected class for a free trial class. The submitted application information is stored in the database and displayed on the user's dashboard.

Software & Hardware Requirements

Software Requirements

- **Frontend:** HTML, CSS, and JavaScript for designing a responsive and user-friendly interface.
- **Backend:** Python with Django for handling URL routing, authentication, application logic, and database operations.
- **Database:** SQLite for storing member information and free-class application data.
- **Authentication:** Django session-based authentication with password hashing using Django's `make_password()` and `check_password()` functions.
- **Development Environment:** Visual Studio Code for writing and managing the project code.
- **Web Browser:** Google Chrome or any modern web browser for accessing and testing the application.
- **Web Server:** Django development server for running the application locally.

Hardware Requirements

- **Processor:** Intel Core i3 or equivalent and above.
- **RAM:** Minimum 4 GB.
- **Storage:** Minimum 10 GB of available storage.
- **Internet Connection:** Required for accessing online resources and external images used in the website.
- **Display:** Standard monitor or laptop display.

Hardware Requirements

- Processor: Intel i5 or higher (or equivalent multi-core processor).
 - RAM: Minimum 8 GB.
 - Storage: At least 100 GB of available storage for the project files, database, and development environment.
 - Connectivity: Internet connection for accessing online resources, external images, and running the web application.
-

Functional Requirements

1. User Module

Users can:

- Register and Login: Create an account and securely log in to access the application.
 - Access Dashboard: View their dashboard after successful login.
- Explore Fitness Classes: View different classes such as Strength Training, HIIT Workout, Yoga, and Cardio Fitness.
- View Nutrition Information: Access nutrition and healthy lifestyle information through the Nutrition section.
- View Membership Plans: Explore different gym membership plans and their features.
- Apply for Free Class: Submit their name, email, phone number, and preferred fitness class through the free-class application form.
 - View Applications: View their submitted free-class applications on the dashboard.

- Navigate Website: Access Home, Dashboard, Nutrition, About, Classes, and Contact pages through the website navigation.
 - Logout: Securely log out of the application.
-

2. Backend & Management Module

The backend provides functionality to:

- User Authentication: Handle registration, login, password verification, sessions, and logout.
 - Member Management: Store and manage registered member information.
 - Free Class Application Management: Store user applications containing name, email, phone number, and selected class.
 - Database Operations: Create, retrieve, and manage member and free-class application records using Django and SQLite.
 - Page Access Control: Restrict protected pages so that users must log in before accessing them.
-

3. Fitness Services Module

This system component provides:

- Fitness Classes: Information about Strength Training, HIIT Workout, Yoga, and Cardio Fitness.
- Nutrition Guidance: Fitness and nutrition-related information for users.
- Membership Plans: Information about Monthly, Quarterly, and Half-Yearly membership plans.
- Free Trial Class: An online application facility for new members interested in attending a free introductory class.

Software Engineering Paradigm

The development of the Unique Fitness Gym and Fitness Management Web Application follows a structured approach to ensure proper development, testing, and maintenance of the system.

Development Model: Adapted Waterfall Model

The project follows an Adapted Waterfall Model, where development is divided into clearly defined stages such as requirement analysis, system design, frontend development, backend development, database integration, testing, and implementation.

Feedback and testing are performed during the development process to identify and fix errors in features such as authentication, navigation, database operations, and free-class applications.

Key Adaptations in the Waterfall Model

1. **Structured Phase Progression:** Each stage of the project, such as requirement analysis, system design, frontend development, backend development, database integration, and testing, follows a defined sequence.
2. **Iterative Refinements:** Feedback and testing allow necessary adjustments during development, such as fixing navigation errors, improving page layouts, and correcting database or authentication issues.
3. **Defined Milestones:** Each development stage is completed before moving to the next phase, such as completing the database structure before implementing database-related backend functionality.
4. **Flexible Adjustments:** The Django-based modular structure allows individual features such as login, dashboard, nutrition, fitness classes, and free-class applications to be developed and modified independently when required.

Phases of Development

1. Requirement Analysis & System Study

- Identifying the goals, scope, and requirements of the **Unique Fitness** project.
- Understanding user requirements and defining core functionalities such as registration, login, dashboard, fitness classes, nutrition, and free-class applications.

2. System Design

- Structuring the **database, modules, navigation, and Django application architecture**.
- Designing the **user interface** for easy navigation and accessibility.

3. Implementation (Coding)

- Backend development using **Python (Django)**.
- Frontend development using **HTML, CSS, and JavaScript**.
 - Database integration using **SQLite**.
- Implementation of user authentication, dashboard functionality, nutrition page, fitness classes, and free-class application functionality.

4. Testing & Debugging

- Testing user registration, login, logout, page navigation, database operations, and free-class applications.
- Debugging errors and improving the functionality and usability of the application.

5. Deployment & Maintenance

- Running the Django application using the **Django development server**.

- Maintaining the application by fixing errors and making necessary updates and feature improvements.

Data Flow Diagram (DFD)

A Data Flow Diagram (DFD) is a graphical representation of how data moves through the Unique Fitness system. It shows how data enters the system, how it is processed, and where the data is stored.

The DFD of the Unique Fitness Gym and Fitness Management Web Application represents the flow of information between users, the Django application, and the SQLite database. It helps in understanding the overall data flow and the interaction between different modules of the system.

The main data flows in the Unique Fitness system include user registration, login information, member details, free-class application details, and fitness-related information.

DFD Components

1. External Entity – User

The User is the main external entity that interacts with the system. The user can:

- Register an account.
- Enter login credentials.
- Access the dashboard.
- View fitness classes and nutrition information.
 - Submit a free-class application.
 - View submitted application details.
 - Logout from the system.

2. Process – Unique Fitness Web Application

The Django-based Unique Fitness application processes the data received from users.

The major processes include:

- User Registration
- User Login & Authentication
- Dashboard Management
- Free Class Application
- Fitness & Nutrition Information
- User Logout

3. Data Store – SQLite Database

The SQLite database stores the information required by the application.

The main data stored includes:

- Member Information
 - Full Name
 - Email
 - Password
- Free Class Application Information
 - Name
 - Email
 - Phone Number
 - Selected Class

4. Data Flow

The major data flows are:

User → Registration → Django Application → SQLite Database

User → Login Credentials → Django Application → Member Verification →
Dashboard

User → Free Class Application → Django Application → SQLite Database

SQLite Database → Application → User Dashboard

DFD – Level 0

You can represent the Level 0 DFD in your manual like this:

Note: This DFD is based on the actual functionality you've provided for your Unique Fitness project, especially the Member and FreeClassApplication data
flow.

Zero Level DFD: Unique Fitness Gym & Fitness Management System

The Zero Level DFD of the **Unique Fitness Gym & Fitness Management System** illustrates the high-level processes and external entities that interact with the system. It highlights the flow of data between the central **Django web application** and its core functional modules, including **Member Management**, **Free Class Application**, **Dashboard**, and **Fitness & Nutrition Information**.

Level 2 DFD: User Registration, Login & Free Class Application Process (Unique Fitness Gym & Fitness Management System)

Second-Level DFD

This Second-Level DFD represents the internal workflow of the **Unique Fitness Gym & Fitness Management System**. After a user registers and logs into the system, the application authenticates the user's credentials and provides access to the dashboard. The user can view available **fitness classes**, access **nutrition information**, and submit an application for a **free fitness class**.

Additionally, the system validates and stores member details in the **Member Database** and stores free-class application details such as name, email, phone number, and selected class in the **Free Class Application Database**. The system also retrieves the user's application information and displays the application status on the dashboard.

ER Diagram

The ER Diagram of the Unique Fitness Gym & Fitness Management System shows the key relationships between Members and Free Class Applications, ensuring structured management of member details and their class application information. The Member entity stores user registration and login details, while the Free Class Application entity stores application details such as name, email, phone number, and selected class. The relationship between these entities represents the submission of free-class applications by registered members.

Simplified ERD: Unique Fitness Gym & Fitness Management System

System Design

The system design for the Unique Fitness Gym & Fitness Management System outlines the structural architecture, functional modules, and data flow required to provide users with an organized and user-friendly fitness management experience.

System Architecture Overview

The application follows a Django-based web application architecture:

- **Frontend (Client-Side):** Developed using HTML, CSS, and Bootstrap to provide a responsive and user-friendly interface for accessing the gym website, dashboard, fitness classes, nutrition information, and other services.
- **Backend (Server-Side):** Powered by Python and Django, handling URL routing, user registration, login authentication, dashboard access, free-class applications, and other application logic.
- **Database Layer:** Uses SQLite for storing member information and free-class application details.
- **Authentication Layer:** Provides user registration and login functionality with password hashing and session-based authentication to protect member-specific pages.

Core System Modules

1. User & Member Module

- **Registration:** Users can create an account by providing their name, email, and password.
 - **Login:** Registered members can securely log in using their email and password.

- Dashboard: After successful login, users can access their dashboard and view relevant information.
- Fitness Information: Users can access available fitness classes and gym-related information.
 - Nutrition: Users can view nutrition and fitness-related guidance.
- About & Contact: Users can access information about the gym and contact-related details.

2. Free Class Application Module

- Users can apply for a free fitness class.
- The system collects details such as name, email, phone number, and selected class.
 - The application details are stored in the database.
- Users can view their submitted application information through the dashboard.

3. Database & Application Management Module

- The system stores registered Member information in the database.
- Free-class applications are stored separately for easy management.
- The application retrieves member-specific applications using the user's email.
- Session management ensures that only logged-in users can access protected pages such as the dashboard and nutrition section.

Backend Design

The backend of the Unique Fitness Gym & Fitness Management System is developed using Python and Django. It handles user registration, login authentication, session management, dashboard access, nutrition pages, and free-class applications.

Authentication Control

The authentication system manages user registration, login, and logout using Django views and sessions.

```
from django.shortcuts import render, redirect
from django.contrib.auth.hashers import make_password, check_password

from .models import Member, FreeClassApplication

# =====

# REGISTER

# =====

def register(request):

    if request.method == "POST":

        full_name = request.POST.get("full_name")
        email = request.POST.get("email")
```

```
password = request.POST.get("password")
confirm_password = request.POST.get("confirm_password")
```

```
if password != confirm_password:
    return render(request, "registration.html", {
        "error": "Passwords do not match."
    })
```

```
if Member.objects.filter(email=email).exists():
    return render(request, "registration.html", {
        "error": "Email already registered."
    })
```

```
Member.objects.create(
    full_name=full_name,
    email=email,
    password=make_password(password)
)
```

```
return redirect("login")
```

```
return render(request, "registration.html")
```

```
# =====
```

```
# LOGIN

    if request.method == "POST":
```

```
        email = request.POST.get("email")
```

```
        password = request.POST.get("password")
```

```
        try:
```

```
            member = Member.objects.get(email=email)
```

```
            if check_password(password, member.password):
```

```
                request.session["member_id"] = member.id
```

```
                request.session["member_name"] = member.full_name
```

```
                request.session["member_email"] = member.email
```

```
            return redirect("home")
```

```
        else:
```

```
            return render(request, "login.html", {  
                "error": "Invalid email or password."})
```

```
            except Member.DoesNotExist:
```

```
return render(request, "login.html", {  
    "error": "Invalid email or password."})
```

```
return render(request, "login.html")
```

```
# =====
```

```
# LOGOUT
```

```
# =====
```

```
def logout_view(request):
```

```
    request.session.flush()
```

```
    return redirect("login")
```

Dashboard Control

The dashboard checks whether the user is logged in and retrieves the user's free-class applications using the registered email address.

```
def dashboard(request):

    member_email = request.session.get("member_email")

    if not member_email:
        return redirect("login")

    applications = FreeClassApplication.objects.filter(
        email=member_email
    ).order_by("-id")

    context = {
        "applications": applications,
        "member_name": request.session.get("member_name"),
    }

    return render(request, "dashboard.html", context)
```

The system allows logged-in members to apply for a free fitness class. The application details are stored in the database.

```
def apply_free_class(request):

    if not request.session.get("member_id"):
        return redirect("login")

    if request.method == "POST":

        name = request.POST.get("name")
        email = request.POST.get("email")
        phone = request.POST.get("phone")
        selected_class = request.POST.get("selected_class")

        FreeClassApplication.objects.create(
            name=name,
            email=email,
            phone=phone,
            selected_class=selected_class
        )

    return redirect("dashboard")
    return redirect("dashboard")
```

Nutrition Control

The nutrition page is accessible only to logged-in members.

```
def nutrition(request):
```

```
    if not request.session.get("member_id"):
```

```
        return redirect("login")
```

```
    return render(request, "nutrition.html")
```

Backend Summary

The backend provides the following major functions:

- User Registration – Creates a new member account and securely hashes the password.
- User Login – Verifies the registered email and password.
- Session Management – Maintains the logged-in member's session.
- Dashboard Management – Displays member information and submitted applications.
- Free Class Application – Stores the user's selected fitness class and contact details.
- Nutrition Access – Restricts the nutrition page to authenticated members.
- Logout – Clears the user's session and redirects to the login page.

Databases Structure

The Unique Fitness system uses a structured database to store and manage important information related to users, fitness programs, nutrition, memberships, and contact inquiries.

The main database tables of the system are:

1.Users

- Stores user registration and login information.
- Contains details such as user ID, name, email, and password.

2.Memberships

- Stores information about different gym membership plans.
- Contains membership type, duration, fees, and facilities.

3.Classes

- Stores details about fitness classes offered by the gym.
- Contains class name, description, schedule, and trainer information.

4.Nutrition

- Stores nutrition and diet-related information provided to users.
- Contains diet plans, food details, and nutritional information.

5.ContactMessages

- Stores messages and inquiries submitted by users through the Contact Us section.
- Contains name, email, message, and submission details.

6.Trainers

- Stores information about gym trainers.
- Contains trainer name, specialization, experience, and contact details.

Database Structure Overview

The database helps the Unique Fitness system manage user information, gym membership plans, fitness classes, nutrition information, trainer details, and customer inquiries in an organized manner. It provides efficient storage and retrieval of data required by different modules of the application.

Future Scope

The **Unique Fitness** web application can be further enhanced by integrating advanced features to improve the overall fitness and gym management experience. Future versions can include personalized workout plans based on the user's fitness goals, body type, workout level, and progress. The system can also provide customized diet and nutrition plans to help users maintain a healthy lifestyle.

The application can be expanded by introducing an online membership and payment system, allowing users to select membership plans, make online payments, and receive membership confirmations digitally. Online class booking can also be implemented so that users can book fitness classes and personal training sessions according to their preferred schedule.

To improve user engagement, a dedicated mobile application for Android and iOS can be developed. The application can provide workout reminders, class notifications, membership expiry alerts, and fitness progress updates. Features such as workout tracking, calorie tracking, BMI calculation, and progress charts can also be added to help users monitor their fitness journey.

For gym administrators, an advanced dashboard can be developed to provide useful information about memberships, users, classes, trainers, and revenue. Attendance management and automated membership renewal reminders can also be integrated to reduce manual work.

In the future, the Unique Fitness system can also incorporate Artificial Intelligence and Machine Learning to provide personalized workout and nutrition recommendations. Integration with wearable fitness devices such as smartwatches can allow the system to collect activity data such as steps, heart rate, and calories

burned. These enhancements can make the system more intelligent, interactive, and useful for both gym members and administrators
